B-cell superantigen (849) is a fragment of SpA D domain that
specifically binds the Fab portion of variable region restricted
antibodies. The SAG is used to enhance production of VH, sepecially
VH3, restricted Abs. During attempts to identify sAgs, as sequences
(R54784-801) of H chains from Ig reactive with mod-SpA, and as and
FNA sequences (FS4862-15, OA4842-55, Of VH regions of SpA binders
obtained from combinatorial libraries were determined. IgM protein
KIM is derived from the germline configuration of a VH gene

Stimulating produ. of variable region gene family restricted antibodies - through B-cell super-antigen vaccination bisclosure; Page 71: 130pp; English.

Disclosure; Page 71: 130pp; English.

A B-cell superantigen (849) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted specifically binds the Fab portion of variable region restricted application of the specially antibodies. The SAG is used to enhance production of WH, especially WH3, restricted Abs. During attempts to identify sAgs, as sequences (R54784-801) of H chains from I reactive with mod-SpA, and as and sequences (R54784-16, 064842-56) of WH regions of SpA binders obtained from combinatorial libraries were determined. 19M protein RIV is derived from the germline configuration of a VH gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A B-cell superattigen (349) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The SAG is used to enhance production of VH, especially VH3, restricted Abs. During attempts to identify sAgs, as sequences (R54784-801) of H chains from Ig reactive with mod 'SpA, and as and DNA sequences (R54802-16, Q64812-56) of VH regions of SpA binders obtained from combinatorial libraries were determined. IGM protein KAS is derived from the germline configuration of a VH gene
                                                                                                                                                                                                                                                                                                                                                                   84 yaqkfqgrvtitadeststaymelsslrsedtavyycardngaycsggscysqwfdpwgq 143
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 vhlv-gsgaevkkpgssvkvsckasggtfssyaiswvrgapggglewmggiipifggany 59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           additional N-linked glycosylation sites are introduced at locations which impair complement fixing and Fc receptor binding ability. They are preferably located in the CH2 region of the Iq molecule. Antibodies bearing multiple sialyl-Lex determinants are useful for disrupting undesirable interactions between cells or proteins. Disrupting this interaction has therapeutic applications, for example, in minimising inflammation following tissue injury. Sequence 481 AA:

The sequences qiven in R31023-24 represent the heavy and light chains the sequences qiven in R31023-24 represent the heavy and light chains which was derived from peripheral blood lymphocytes from a hepatitis A virus (HAV) sero positive patient. Antibody D is closely related in nature to murine antibody B5B3. Total RNA was isolated from antibody D expressing cells and polyademylated RNA was extracted. These polyARNA's were used to prepare a cDNA library which was screened for human Further heavy (H) chains and two positive clones were detected.

Further heavy (H) chain clones were also isolated.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This polypeptide sequence comprises the heavy chain variable region (YR), HBBL, obtained by mutagenesis of the YH CDB3 of human carcinoembryonic antigen (hCBA) specific antibody CEA6 (see W19881). A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 cextracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include pairings of YH and VL variants (see W19886-95) obtained by a swell as CEA6 VH and VL variants (see W19886-95) obtained by comparenesis or chain shuffling. An example of a claimed pairing is HBB11 VH with CEA6 VL. (A) is used to detect cells expressing CEA6. In vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocarcinoma of the colon, lung or breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  60 yaqkfqgrltitadeststaymelsslrsedtavyycarhnhny--elyyy--ymdvwqq 115

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 EVQLLEQSGAEVKKPGSSVKVSCKASGGTFSGHVISWVPGAPGGGIEWMGGSISFFGTSN 60
                                                                                                                         This projected sequence comprises the heavy chain variable region (VH), HBAll, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigen (hEA)-specific antibody 'CEA' (see THIOR) and specific binding member (A) comprises an hEA specific antibody antigen binding domain that has a dissociation constant for hEBA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hEBA and/or to cell-associated hEBA over hCEA over soluble hCEA. Preferred (A) include pairings of VH and VL sequences from (FAI)-7 (see W1986-95) or their CDR sequences, as well as CEAG VH ushutgenesis or chain shuffling. (A) is used to detect cells expressing hCEA, in vivo or in vitro, especially tumour cells for

A claimed specific binding member (A) comprises an hCBA specific antibody antigen binding domain that has a dissociation constant for hCBA of less than 1 x 10 - 8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCBA and/or to cell-associated hCBA over
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Specific binding members for human carcinoembryonic antigen - bind to the A3-B3 extracellular domain of hCEA and are substantially
Specific antibody antigen binding member (A) comprises an hCFA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 - 8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over Neba or soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA-7 (see W19876-85), or their CPB sequences, as well as CEA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. An example of a claimed pairing is HBB6 VH with CEA6 VL. (A) is used to detect cells expressing hCEA, in vivo or in viltro, especially tymour cells for disgnosting cancer, e-q. adenocarcinoma of the colon, lung or breast.

A human anti-Varicocalla coster virus monoclonal antibody was prepd.
using the trioma method of Ostberg et al. (1983) Hybridoma 2:351-357.
One resultant trioma neutralised VZV in the absence of complement.
This cell line, designated cell line 109.8849, produced an antibody genes cell line, designated 938A9 cDNA, for the light and heavy chain variable region heavy chain (gamma-1) and two light chain (kappa) specific clones sequence 147 AA.

hoth over soluble hoth Preferred (A) include pairings of VH and VL sequences from CEA1-7 (see W19475-85) or their OFP sequences. as well as CEA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. Examples of claimed pairings are lifely VH with locklic or CEA5 VL. (A) is used to detect ceils expressing hoth in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g adenorarinoma of the colon, lung or breast

same type as the patient's tumour; (c) removing extraneous antibodies by absorption against normal human cells; (d) cloning the phage selected in step (b) and (c); (e) assaying the specificity of the cioned phage by incubating the phage with at least two types of cultured normal cells; and (f) further testing the specificity of cloned phage that do not bind to either cell line of cultured normal cells;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to cultured tumour cells derived from more than one other tumour that is not the patient's tumour. The present sequence represents a human heavy chain antibody, from a VH antibody fusion phage library, produced by a method as described above. The antibodies produced can be used for diagnostic and therapeutic applications and for isolating tumour antigens for studying tumourigenesis or for use as anti-cancer vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 19; Page 75-76; 82pp; English.

A process for isolating and synthesising human monoclonal anti-tumour antibodies has been produced. The process involves: (a) constructing at least one fusion phage library from the peripheral blood lymphocytes (PBLs) of a cancer patient; (b) screening for anti-tumour antibodies in the phage library in a binding assay with cultured tumour cells of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The human antibodies have low immunogenicity in humans compared to murine monoclonal antibodies (MAbs). Since the antibodies are isolated from fusion phage libraries, their affinity and specificity for a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           67 rvtitadkststaymelsslrsedtavyyca····r·ygyr·ydaf·diwyggtlvtvs 118

A B-cell superantigen (sAg) is a fragment of SpA D domain that specifically binds the Fab portion of Variable region restricted antibodies. The sAg is used to enhance production of WH, especially VH3, restricted Abs. During attempts to identify sAgs, as sequences

Immunoglobulin trans:genes - for prodn. of heterologous firmunoglobulin trans:genes - for prodn. of heterologous non-rearranged and/or rearranged ig chains
Example 14: Page 87: 172pp: English.
The human placental genomic DNA library cloned into the phage vector lambda FIX II was screened with the human VHI family specific oligonucleotide (see 022418). Phage clone lambda 49.8 was isolated and a 6.1 kb xbai fragment contg. the variable segment VH49.8 subcloned into pNN03 to generate plasmid pVH49.8.
An 800 bp region of this insert was sequenced. VH49.8 was found to have an open reading frame which encoded the sequence shown.
(R72070) sequences of the VH region of a representative clone, OF7H1.2, are provided.
                                                                                                                                                                                                                                                                                                                                                                                        17-AUG-1992 (first entry)
Protein encoded by the human heavy chain V region gene VH49.8.
Heavy chain; variable region; VH1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 560; DB 4; Length 117;

                                                                                                                                                                      Example 12; Page 96; 196pp; English.
A human placental genomic DNA library cloned into the phage vector lambda FIX II was screened with mean VHI family specific ollygonuclectide Q44184. Phage clone lambda 49.8 was isolated and a
                                                                                                                                                                                                                                                                    6.1kb Xbal fragment containing the variable segment VH49.8 was subcloned into pNNO3 to generate plasmid pVH49.8. An 800bp region of this insert was sequenced (Q44185) and VH49.8 found to have an open reading frame and intact splicing and recombination signals, indicating that the gene is functional. Amino acid sequence Q44185 was deduced from the coding sequence; the last 3
